

Selenium Revision Notes

Quick-reference cheat sheet

1. JavaScript Executor

Used when a normal click/sendKeys fails, an element is hidden, or DOM manipulation is needed.

```
JavascriptExecutor js = (JavascriptExecutor) driver;

// Scroll down by 1500 pixels
js.executeScript("window.scrollTo(0,1500)");

// Scroll until element is visible
js.executeScript("arguments[0].scrollIntoView()", element);

// Click using JavaScript
js.executeScript("arguments[0].click()", element);

// Set value in textbox
js.executeScript("arguments[0].setAttribute('value','Sameer')", element);
```

When to use:

- Element not clickable
- sendKeys() not working
- Need to scroll to a hidden element
- DOM manipulation required

2. Date Picker Handling

```
String expectedMonth = "December";
String expectedDate = "26";
String expectedYear = "2026";
```

Golden rule

Inside while loop	Outside while loop
Current Year element	Click target date
Current Month element	
Next / Previous button	

Do not use exact locators (month/year change dynamically):

```
//span[text()='December'] //span[text()='2026']
```

Use generic locators instead:

```
By.className("ui-datepicker-year")
By.className("ui-datepicker-month")
```

Compare values using getText(). When month and year match → break; → exit loop → click target date.

3. File Upload Handling

Single file upload

```
WebElement file = driver.findElement(By.id("singleFileInput"));
file.sendKeys("C:\\Files\\Patient.txt");
```

Multiple file upload

```
WebElement file = driver.findElement(By.id("multipleFilesInput"));  
file.sendKeys(file1 + "\n" + file2);
```

Interview Answer — Date Picker Handling

1. Open the calendar.
2. Capture the current month and year dynamically.
3. Compare them with the expected month and year.
4. If they don't match, click Next or Previous.
5. Repeat until the required month and year are reached.
6. Break the loop.
7. Select the target date.
